

A new option for your patients

- Adjust anywhere
- Lightweight
- Immediate fit
- Greater versatility
- Customizable

We now have two options for your patients.
Introducing our new, adjustable low profile transfemoral device. Another tool to help those with limb loss.

iFIT transfemoral sockets have unique advantages for fitting persons with transfemoral limb loss including lower cost, adjustability, consistency of quality in manufacturing, and the immediacy of fit that speeds the rehabilitation process.

- Fit in a single visit using just hand tools, the iFIT prosthesis limits the number of visits needed to get immuno-compromised patients mobilized faster.
- The system can easily accommodate highly compressible thigh tissue for total contact — ideal as a preparatory prosthesis for any individual that desires greater adjustability.
- A specially designed light weight offset offers rotation and various degrees of flexion of the socket to facilitate the alignment process.
- Fit the iFIT system virtually anywhere — nursing homes, hospitals, patients homes, etc...
- Clinically tested and scientifically proven to provide high levels of comfort for persons with transfemoral limb loss.
- The socket opens up to allow for easy donning and doffing, while the buckle system allows for a snug fit that can be adjusted any time to accommodate volume fluctuations.
- Patients can adjust their fit any time without using socks — no extra visits for adjustments.
- Greater sitting comfort as there is no proximal brim to deal with.

iFIT can help you and your practice exceed patients' expectations. A person can be fit in just under 2 hours with the iFIT system which minimizes exposure to you and your staff. Using the appropriate PPE (Personal Protection Equipment), you can help those who need a prosthesis now.

Give patients the mobility they deserve and the freedom they expect.

Adjust with iFIT!
