ComfortPAD™

ComfortPAD™ is a padding solution designed for the Allard AFO Ypsilon® Flow½. It is designed to reduce friction between the orthosis and the leg, particularly during activities such as running, cycling and walking. The additional layer of textile material between the orthosis and the skin allows the materials to glide more smoothly against each other. Tests show that friction against the skin can be reduced by approximately 25% as the materials glide against each other.

ComfortPAD™ is available in one size and is easy to put on and take off, even with just one hand. The wide band provides excellent comfort and helps reduce pressure on the back of the leg. ComfortPAD™ Ypsilon® Flow is specifically designed for Ypsilon® Flow½. ComfortPAD™ is a comfortable solution for individuals with a sensitive lower leg or sensitive skin who want to maintain an active lifestyle

Recommended Range Of Application

Ideal for support activities such as running or bicycling. May also be the interface of choice for individuals who continue to experience pressure on the tibia even though their Ypsilon® FLOW½ is properly aligned, or for patients with small proximal tibia protuberances that press against the Ypsilon® FLOW½'s anterior support.
